Excerpt from Nbs Calibration Procedures for Horizontal Dipole Antennas (25 to 1000 Mhz) This publication describes the theoretical basis and test procedures for horizontally polarized dipole calibrations at the National Bureau of Standards. Two different techniques and two different test sites are used. The standard antenna method uses the calculation of a field strength level, from the response of a simple half-wave dipole, to calibrate an antenna. This method is used at an open field site in the frequency range of 25 to 1000 mhz. The standard field method applies the theoretical gain equations of waveguides to determine the field strength level. This latter method is used in an anechoic chamber in the frequency range of 200 to 1000 mhz. Procedures for both techniques are explained and measurement setups are illustrated.

Measurement uncertainties are discussed. Sample reports are included for both methods. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
